Lifetime Warranty

At Camillus® our products are supported by an equally unparalleled promise. If your Camillus product fails to perform due to defects in materials or workmanship, we will replace it regardless of age. Normal wear, sharpening, industrial use or abuse, misuse or neglect is not covered. Defective products will be repaired, replaced or substituted with the same product or one of equal value. Send the product in its original box for proof of purchase along with an explanation of defect. Replacement blades and springs are excluded from the lifetime warranty. Other consumer rights may vary from state to state. Camillus shall in no event be liable for incidental or consequential damages. Some states do not allow the exclusion or limitation or incidental or consequential damages, so the above exclusion may not apply to you. Replacement blades are excluded from the Camillus Warranty.

Camillus reserves the right to change or substitute product materials as stated within this catalog

Camillus...Unparalleled, Unprecedented and Unleashed

Since 1876, Camillus Cutlery has been supplying the world with reliable, innovative and quality-made knives and tools that have survived the true test of time. As one of the oldest knife manufacturers, Camillus Cutlery has always answered the call for quality and will continue to do so with our hunting, sporting, tactical knives and tools.

Craftsmanship with a worldwide following – it's been the Camillus way for over 140 years.

Camillus products are made of cutlery-grade steel and are through-hardened to hold an edge. Camillus knives withstand the impossible task and continue delivering over extended use.

TERMINOLOGY

Carbonitride Titanium is one of the hardest surface treatments containing titanium. Harder than carbide. Harder than chrome. Our proprietary process creates a permanent molecular bond with the blade surface. Will not flake, blister, chip, or peel. A complex crystalline structure forms which protects the blade surface against wear, staining, and damage. Patent pending technology.

TITANIUM NON-STICK

Our proprietary new coating bonds Titanium with a non-stick formula. Highly resistant to adhesives including tape, glue, Velcro® and natural adhesive substances such as sap. This is a durable micro ceramic coating that will not wear off – up to 100,000 cuts. It is 5X harder than Stainless Steel alone and will stay sharper longer.

Titanium Bonded is not painted or plated, but an application of a unique formulation of titanium and chromium nitride to the surface of cutting blades that actually penetrates and treats the metal to create a permanent bond. The patented Titanium Bonding process provides the following benefits; corrosion resistance, adhesive resistance and the process itself makes the stainless steel 3x harder than untreated stainless, providing a blade that stays sharper longer.

TITANIUM

Titanium alloy is a lightweight alloy, corrosion resistant and is incredibly strong. Titanium alloy also has a very high tensile strength, toughness and ability to withstand extreme temperatures. Camillus uses Titanium Alloy on select knife frames for added strength, without increasing the weight of the knife.

KNIFE ANATOMY

Backbone

Backbone refers to the thickness of the blade. The backbone is the strength behind the cut. A thick backbone provides an unparalleled rigidity so the cut is as straight and true as intended.

Serration

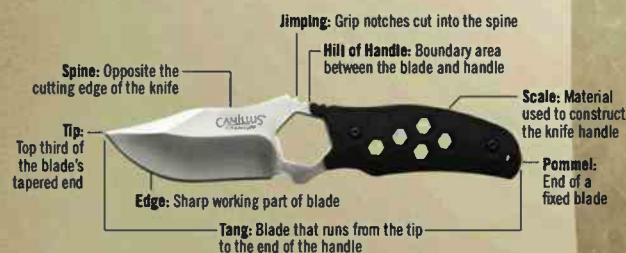

Some materials require a “sawing motion” vs. a slicing motion. Camillus offers various serration patterns on our knives to provide you with the most appropriate, desired cut.

Tang

Describes the back or stock portion of the blade that extends into the handle or actually comprises the handle (called **full tang**).

Pommel

The end of the knife handle. Some pommels are reinforced with steel to allow for cracking. Other knives simply have a lanyard hole at the end of the handle.

SPECIAL FEATURES

Cuda Launch Tech

The small disc located at the fulcrum of the knife is used to open the knife.

Cuda Lock

Allows for ambidextrous unlocking. A steel bar slides into place holding the blade open. Blade is unlocked by sliding the button back from either side of the knife.

Ball Bearings

Cartridge bearings are placed on either side of the knife at the fulcrum point. Ball bearings allowing for an incredible smooth opening and closing.

Lock Types

Liner Lock: The interior liners of the knife has spring that moves into position once knife is opened.

Frame Lock: Similar in concept to the liner, but in this case the outside of the handle locks the blade open.

Lock Back: Historically one of the most common locking mechanisms. A small bar on the back of the knife must be depressed to release the blade. Requires two hands to unlock and close blade.

BLADE TYPES

Drop/Clip Point

All-purpose blade mainly used for hunting

Tanto

Thick tip for strength and cutting purposes

Sheepsfoot

Straight cutting edge for cutting and slicing

Guthook

Useful for field dressing wild game

Serrated

Partial Serration used to cut hard material

Cleaver

This blade features a blunt front end similar to what you might find at your local butcher, these blades are great for slicing, cutting and opening.

TERMINOLOGY

STEEL TYPES

VG10

A unique formulation of steel with a high carbon content. It contains various amounts of one or more of the following Chromium, Vanadium and Cobalt. VG10 is considered a "super steel," because it is designed to maintain sharpness and durability. In addition to its exceptional edge retention, being a stainless steel, VG10 is also surprisingly corrosion resistant due to its fairly high chromium content.

AUS-8

AUS-8 is a Japanese medium-carbon, high-chromium stainless steel. One word says it all, "balance". It offers exceptional balance between toughness, edge sharpness, and corrosion resistance. Balance provides lasting value. AUS-8 ranks among the hardest, toughest, and most rust-resistant knife alloys. It's a trusted favorite that enthusiasts prefer time and again.

D2

This air hardened tool steel is sometimes called a "semi-stainless" steel, because it contains 12% chromium. It offers decent corrosion resistance with exceptional edge retention. It is harder to sharpen than most, but can be finished to a high-polish shine.

Sandvik 12C27

This stainless steel is made in Sweden. It is generally known as a premium steel for knife blades, offering a good balance of corrosion resistance, sharpenability and edge retention.

440

A stainless steel with a terrific balance between hardness and corrosion resistance. 440 takes a nice edge and is fairly easy to re-sharpen. An excellent value-priced steel for its performance. Good toughness and stain resistance.

1095 High Carbon

An easy-to-sharpen carbon steel used in knife making. It contains carbon and little else. It is strong and a great overall knife steel.

420

A hard, strong blade steel. This stainless steel is commonly used in knife blades, and offers good corrosion resistance at a low cost. Decent edge holding capabilities and fairly easy to resharpen, this steel is a good balance of the most desirable traits for knife steel.

420J2

A stainless steel that has a low carbon content and has a high chromium content, making it a shock absorbing steel that bends instead of breaking. The 420J2 has excellent resistance to corrosion, high stain resistance and fair edge holding capability.

Carbide Edge

Carbide material is deposited on the blade edge using laser as a heat source, creating a mechanical bond between the base material and cutting edge. It creates a protective edge which provides long lasting sharpness to the blade edge and increases corrosion-resistance.

KNIFE HANDLE MATERIALS

Glass Filled Nylon

Glass filled nylon handles are used in many of our knives. We add glass-filled materials to polypropylene, ABS and other substrates in order to provide the strongest, most rigid handles.

Bamboo

Bamboo is an environmentally sustainable organic grass, wood-like material. This means Camillus is preserving the environment by using a material that regenerates quickly. Bamboo handles are also moisture and stain resistant while providing a fantastic gripping surface.

Carbon Fiber

Carbon fiber is actually made from a polymer called polyacrylonitrile combined with woven Kevlar® during a complicated heating process. It is widely used because it has a number of characteristics that make it ideal for products required to be light in weight but extremely strong. Carbon fiber is 5X Stronger than steel and lighter than aluminum.

Micarta®

A synthetic material made from paper, linen or thick canvas impregnated with resin under pressure. Micarta is extremely resistant to water, cold, heat, rot or corrosion therefore it is a perfect material for knife handles.

G10

An extremely durable makeup of layers of fiberglass soaked in resin, then highly compressed and baked. Impervious to moisture or liquid and physically stable under climate change.

ABS

ABS is a thermoplastic polymer with plastic and rubber properties providing durability, strength and resistance to extreme temperatures. It is a commonly used material in making knife handles.

Delrin

Delrin is a crystalline plastic that is extremely durable and stable. It is resistant to water and harsh weather conditions. It is commonly used in knife handles that resemble stag or antler.

SHEATH MATERIALS

Ballistic Nylon

Ballistic nylon is a thick, tough, synthetic nylon fabric that protects against debris and other foreign materials. It is commonly used for making sheaths.

Polypropylene (PP)

Polypropylene is a thermoplastic polymer used in making ergonomic knife handles and sheaths.

Leather

Leather is one of the oldest materials used in sheath making. The flexibility and conformity continues to make it one of the most popular types of materials used in sheath making today.

ABS

ABS is a thermoplastic polymer with plastic and rubber properties providing durability, strength and resistance to extreme temperatures. It is a commonly used material in making knife handles and sheaths.

Kydex®

KYDEX is a plastic that combines the advantageous properties of both the acrylic and the polyvinyl chloride components. The combination of strength properties of KYDEX® places it at the highest level among thermoforming materials making it perfect for a form fit knife sheath.

CAMILLUS®

Quality Knives Since 1876

FOLDING KNIVES

Camillus folding knives are made from the very best steels with Titanium Bonded blades. These blades are harder than untreated steel and will stay sharper for a longer period of time, while resisting stains and corrosion. Included in the folding knife category are knives that feature Marlin Spikes along with the CUDA® and Lev-R-Lok® lines of quick-action blade knives.

FIXED BLADES

Camillus Fixed Blade Knives are made from the very best steel. Fixed blade knives with Carbonitride Titanium blades are 10x harder than untreated steel and will stay sharper for a longer period of time, while resisting corrosion. Included in the fixed blade knife category are all knives ranging from the Heater™ all the way up to the Carnivore® Machete.

TigerSharp
TECHNOLOGY

Sharp TigerSharp replaceable blade system means your Camillus knife will never need sharpening.

Easy Replacing a blade is as easy as 1-2-3!

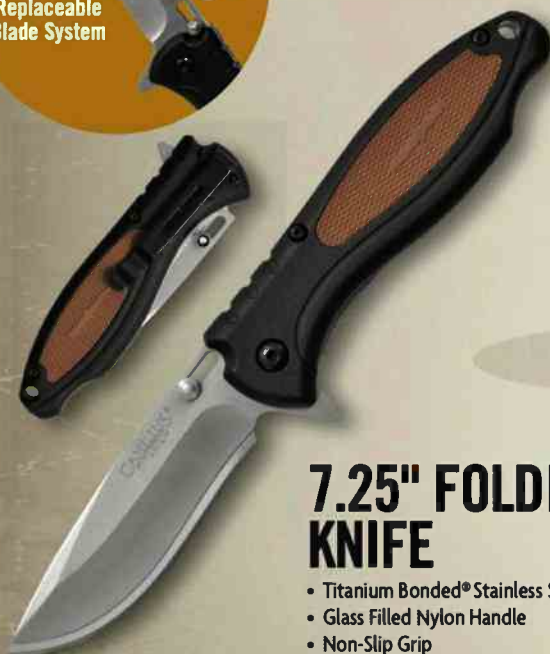

Tough Titanium Bonded® blades last longer because they are 3x harder than ordinary steel blades.
